Second Tuesday of Month 6:30PM

The City of Cumberland treats surface water from the Poor Fork of the Cumberland River. A Source Water Assessment Plan indicates that our susceptibility rating is high. Land use within the Poor Fork watershed is composed mainly of residential, mining, transportation corridors and logging activities. Potential sources of contamination include roads, railways, mine sites, underground storage tanks and wastewater discharges. Activities and land uses within the watershed can pose potential risks to your drinking water. Under certain circumstances contaminants could be released that would pose challenges to water treatment or even get into your drinking water. These activities, and how they are conducted, are of interest to the entire community because they potentially affect your health and the cost of treating your water. The complete source water assessment can be reviewed at our office.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects may be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and may pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include: Microbial contaminants, such as viruses and bacteria, (sewage plants, septic systems, livestock operations, or wildlife). Inorganic contaminants, such as salts and metals, (naturally occurring or from stormwater runoff, wastewater discharges, oil and gas production, mining, or farming). Pesticides and herbicides, (stormwater runoff, agriculture or residential uses). Organic chemical contaminants, including synthetic and volatile organic chemicals, (by-products of industrial processes and petroleum production, or from gas stations, stormwater runoff, or septic systems). Radioactive contaminants, (naturally occurring or from oil and gas production or mining activities). In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water to provide the same protection for public health.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Your local public water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

**Some or all of these definitions may be found in this report:**

Maximum Contaminant Level (MCL) - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) - the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) - the level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Below Detection Levels (BDL) - laboratory analysis indicates that the contaminant is not present.

Not Applicable (N/A) - does not apply.

Parts per million (ppm) - or milligrams per liter, (mg/L). One part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) - or micrograms per liter, ( $\mu\text{g/L}$ ). One part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Parts per trillion (ppt) - one part per trillion corresponds to one minute in 2,000,000 years, or a single penny in \$10,000,000,000.

Parts per quadrillion (ppq) - one part per quadrillion corresponds to one minute in 2,000,000,000 years or one penny in \$10,000,000,000,000.

Picocuries per liter (pCi/L) - a measure of the radioactivity in water.

Millirems per year (mrem/yr) - measure of radiation absorbed by the body.

Million Fibers per Liter (MFL) - a measure of the presence of asbestos fibers that are longer than 10 micrometers.

Nephelometric Turbidity Unit (NTU) - a measure of the clarity of water. Turbidity has no health effects. However, turbidity can provide a medium for microbial growth. Turbidity is monitored because it is a good indicator of the effectiveness of the filtration system.

Variations & Exemptions (V&E) - State or EPA permission not to meet an MCL or a treatment technique under certain conditions.

Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system shall follow.

Treatment Technique (TT) - a required process intended to reduce the level of a contaminant in drinking water.

Spanish (Español) Este informe contiene información muy importante sobre la calidad de su agua beber. Tradúzcalo o hable con alguien que lo entienda bien.

**To understand the possible health effects described for many regulated contaminants, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.**

The data presented in this report are from the most recent testing done in accordance with administrative regulations in 401 KAR Chapter 8. As authorized and approved by EPA, the State has reduced monitoring requirements for certain contaminants to less often than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of the data in this table, though representative, may be more than one year old. **Copies of this report are available upon request by contacting our office during business hours.**

**Regulated Contaminant Test Results Cumberland Water Works**

Contaminant [code] (units)	MCL	MCLG	Report Level	Range of Detection	Date of Sample	Violation	Likely Source of Contamination
----------------------------	-----	------	--------------	--------------------	----------------	-----------	--------------------------------

**Radioactive Contaminants**

Beta photon emitters (pCi/L)	50	0	1.98	1.98 to 1.98	Dec-17	No	Decay of natural and man-made deposits
Alpha emitters [4000] (pCi/L)	15	0	2.76	2.76 to 2.76	Dec-17	No	Erosion of natural deposits
Combined radium (pCi/L)	5	0	1.552	1.552 to 1.552	Dec-17	No	Erosion of natural deposits
Uranium (µg/L)	30	0	0.193	0.193 to 0.193	Dec-17	No	Erosion of natural deposits

**Inorganic Contaminants**

Antimony [1074] (ppb)	6	6	1	1 to 1	Apr-20	No	Discharge from petroleum refineries; fire retardants; ceramics; electronics; solder
Barium [1010] (ppm)	2	2	0.042	0.042 to 0.042	Apr-20	No	Drilling wastes; metal refineries; erosion of natural deposits
Fluoride [1025] (ppm)	4	4	0.66	0.66 to 0.66	Apr-20	No	Water additive which promotes strong teeth
Nitrate [1040] (ppm)	10	10	0.24	0.24 to 0.24	Aug-20	No	Fertilizer runoff; leaching from septic tanks, sewage; erosion of natural deposits
Selenium [1045] (ppb)	50	50	1	1 to 1	Apr-20	No	Discharge from petroleum and metal refineries or mines; erosion of natural deposits

**Disinfectants/Disinfection Byproducts and Precursors**

Total Organic Carbon (ppm) (measured as ppm, but reported as a ratio)	TT*	N/A	1.28 (lowest average)	1.00 to 2.48 (monthly ratios)	2020	No	Naturally present in environment.
---	-----	-----	-----------------------	-------------------------------	------	----	-----------------------------------

\*Monthly ratio is the % TOC removal achieved to the % TOC removal required. Annual average must be 1.00 or greater for compliance.

Chlorine (ppm)	MRDL = 4	MRDLG = 4	1.31 (highest average)	0.29 to 2.05	2020	No	Water additive used to control microbes.
HAA (ppb) (Stage 2) [Haloacetic acids]	60	N/A	40 (high site average)	17 to 61 (range of individual sites)	2020	No	Byproduct of drinking water disinfection
TTHM (ppb) (Stage 2) [total trihalomethanes]	80	N/A	55 (high site average)	20.1 to 86 (range of individual sites)	2020	No	Byproduct of drinking water disinfection.

**Household Plumbing Contaminants**

Copper [1022] (ppm) sites exceeding action level 0	AL = 1.3	1.3	0.006 (90 <sup>th</sup> percentile)	0.001 to 0.072	Aug-20	No	Corrosion of household plumbing systems
Lead [1030] (ppb) sites exceeding action level 0	AL = 15	0	0 (90 <sup>th</sup> percentile)	0 to 1	Aug-20	No	Corrosion of household plumbing systems

<b>Other Constituents</b>					
<b>Turbidity (NTU) TT</b> * Representative samples	<b>Allowable Levels</b>	<b>Highest Single Measurement</b>	<b>Lowest Monthly %</b>	<b>Violation</b>	<b>Likely Source of Turbidity</b>
Turbidity is a measure of the clarity of the water and not a contaminant.	No more than 1 NTU* Less than 0.3 NTU in 95% of monthly samples	1.3	94	Yes	Soil runoff

	<b>Average</b>	<b>Range of Detection</b>
<b>Sodium (EPA guidance level = 20 mg/L)</b>	41.8	41.78 to 41.78

Secondary contaminants do not have a direct impact on the health of consumers. They are being included to provide additional information about the quality of the water.

<b>Secondary Contaminant</b>	<b>Maximum Allowable Level</b>	<b>Report Level</b>	<b>Range of Detection</b>	<b>Date of Sample</b>
Aluminum	0.05 to 0.2 mg/l	0.11	0.11 to 0.11	Mar-20
Chloride	250 mg/l	7.58	7.58 to 7.58	Mar-20
Copper	1.0 mg/l	0.001	0.001 to 0.001	Mar-20
Corrosivity	Noncorrosive	0.2	0.2 to 0.2	Mar-20
Fluoride	2.0 mg/l	0.6	0.6 to 0.6	Mar-20
pH	6.5 to 8.5	8.3	8.3 to 8.3	Mar-20
Sulfate	250 mg/l	148.52	148.52 to 148.52	Mar-20
Total Dissolved Solids	500 mg/l	1002	1002 to 1002	Mar-20

Violation Details: **2020-9950645 Compliance Period: 02/01/2020 - 02/29/2020** Our water system failed to meet the treatment technique requirement for turbidity by exceeding 0.3 NTU in over 5% of the combined filter effluent samples collected. 5.79% of the samples (7 out of 121) exceeded the limit. Notices were mailed out accordingly and since we have had no issues with meeting this requirement. **2020-9950646 Compliance Period: 07/01/20 - 07/31/20** Our water system exceeded the 1.0 NTU MCL for Turbidity in a sample collected. Notices were mailed out accordingly during the required time period. We have not had any more issues since this occurrence and have been returned to compliance.

Turbidity. Turbidity has no health effects. However, turbidity can interfere with disinfection and provide a medium for microbial growth. Turbidity may indicate the presence of disease-causing organisms. These organisms include bacteria, viruses, and parasites that can cause symptoms such as nausea, cramps, diarrhea, and associated headaches.
